Easy read guide to the pneumococcal vaccine

A vaccine to help stop you getting ill from pneumonia and meningitis

Pneumococcal vaccine:
a vaccine to help stop you
getting ill from pneumonia
and meningitis

What is a pneumococcal infection?

The pneumococcal infection is caused by bacteria. Infection is when bacteria gets in your body

Bacteria are tiny bugs that can make people ill

The infection can cause illnesses like bronchitis, ear and sinus infections

It can also cause serious illnesses, such as pneumonia and meningitis

Pneumonia is an infection of the lung

Meningitis is a serious illness which affects your brain and spinal cord

Who can get a pneumococcal infection?

Anyone can get a pneumococcal infection

People who are more likely to get the infection are:

children under 2 years old

people aged 65 years or over

people who work with metal fumes,
like a welder

people with a long-term health illnesses

Some adults and children carry the bacteria in the back of their nose and throat

You can pass the bacteria around by coughing, sneezing and getting close to other people

The pneumococcal vaccine

The pneumococcal vaccine helps protect against a pneumococcal infection

A vaccine is a medicine that helps people fight off serious disease. You might hear people talk about a vaccine as a jab or an injection

The vaccine is the safest and best way to protect yourself from infections caused by the most common pneumococcal bacteria

The vaccine cannot cause an infection

If you are not sure whether you should get the vaccine, ask your GP or practice nurse

Side effects

If you get any side effects they are usually mild and go away within a few days

Side effects are how you might feel after getting a medicine like a vaccine

You might get:

a lump or it may feel sore where you got the vaccine

a fever, temperature above 37.8C

You can report side effects of vaccines and medicines by going to this website yellowcard.mhra.gov.uk

Or by calling the Yellow Card hotline on 0808 100 3352
